

Olmesartan Combined with Amlodipine is More Effective in Reducing Parameters of Oxidative Stress in Diabetic Hypertensives as Compared with Monotherapy.

Derosa G, et al. Medicine (Baltimore). 2016; 95(13):e3084.

- A 12 month study evaluated effects of a fixed combination of olmesartan/amlodipine compared with olmesartan or amlodipine alone on parameters of endothelial damage [lipoprotein (a), myeloperoxidase (MPO), isoprostanes, and paraoxonase-1 (PON-1)] in 221 diabetic hypertensive patients.
- Fixed combination of olmesartan/amlodipine was more effective than individual monotherapies in reducing oxidative stress in diabetic and hypertensive patients.

Olmesartan Combined with Amlodipine was more effective than either drug alone in reducing oxidative stress in diabetic and hypertensive patients
