

Rosuvastatin Therapy is Beneficial in Deep Vein Thrombosis.

San Norberto EM, et al. *Vasa*. 2016; 45(2):133-40.

- Statins have been reported to help prevent the development and the recurrence of deep vein thrombosis (DVT).
- A 3 month study comparing the effects of rosuvastatin plus a low-molecular-weight heparin (LMWH) vs. conventional LMWH therapy in the treatment of DVT (230 patients) indicated that adjuvant rosuvastatin treatment exerted an anti-inflammatory effect and reduced incidence of post-thrombotic syndrome, the most common complication of DVT.

Rosuvastatin exerts a beneficial anti-inflammatory and anti-thrombotic effect in patients with DVT.
