

The role of aceclofenac in complex treatment of nonspecific low back pain.

Cherevatenko RF. Khirurgiia (Mosk). 2018; 12: 96-99.

- In this study, 120 patients (of age between 18-78 years) with low back pain took participation. The age of the majority of patients was over 40 years.
- In case of acute pain, duration of treatment ranged from 5 to 24 days, in sub-acute and chronic pain, 3 to 14 and 7 to 30 days, respectively.
- Aceclofenac as a non-steroidal anti-inflammatory drug (NSAID) showed high efficacy for acute and chronic low back pain. Good results were observed in 89.2% of cases, and satisfactory in 10.8% of patients.
- Aceclofenac proved to be a safe drug for elderly patients, only 8.3% of patients noted dyspepsia.
